Term 6 Checklist: Chemical Reactions

Topic	Learning Outcomes	RAG	
		1	2
Chemical Reactions	Give examples of chemical and physical changes		
	Describe the difference between chemical and physical changes in terms of particles		
	Describe changes of state in terms of forces between particles		
	Recall the formulae of common chemical compounds e.g. water, carbon dioxide, methane		
	Describe the difference between compounds and mixtures		
	Explain why the properties of elements change when they react together		
	Know what these parts of a chemical equation mean: reactants, arrow, products		
	Write chemical word equations when given the reactants and products		
	Predict the names of chemical compounds made from metals and non-metals		
	Predict the names of chemical compounds made from metals, non-metals and oxygen		
	Describe what is meant by thermal decomposition		
	Explain why the mass of a metal carbonate decreases when it is heated		
	State the general chemical word equation for the reaction of acids and metal oxides		
	Predict the products of reactions between metal oxides and acids		
	State the order of common metals in the reactivity series		
	Define the term displacement reaction		
	Predict whether a given metal and metal salt will react together using the reactivity series		
	Explain why gold and silver are used for jewellery in terms of reactivity		
	Explain why a solid precipitate is observed in the displacement of copper sulphate by iron (HT only)		
	Describe the difference between a solution and a chemical compound		
	Compare physical and chemical properties		
	Describe the properties of metals that make them useful in cooking pans and wires		
	Explain why metals are malleable and good conductors of electricity (HT only)		
	Write a chemical word equation for the rusting of iron		
	State factors which increase the rate of rusting		
	Explain why it is important to paint the outside of cars and boats
