Year 8: Staying Alive – Reproductive Systems

What is sexual reproduction?
- The production of new organisms by combining **genetic information** from two individuals
- Both a male and female parent are needed
- This produces offspring that are **genetically unique** and different from either parent
- Two **sex cells** are need, sperm from males and egg cells from females

A labelled diagram showing the parts of the female reproductive system

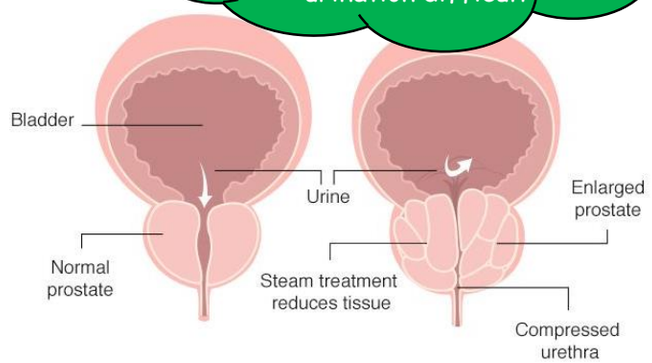

Male external genitalia
- The **penis** is a cylindrical rod which can carry **semen** and **urine**
- When **sexually aroused** the penis will become erect (stiff)
- This makes it easier for the penis to penetrate the vagina
- The **scrotum** holds the testis outside of the body, helping them to stay cool

Part	Function
Penis	Allows urine and semen to pass out of the male's body
Testis	Produces sperm cells and releases the male sex hormone testosterone
Urethra	A tube that carries urine and semen. It has a ring of muscle to keep the fluids separate
Scrotum	A bag of skin that contains the testes and helps keep them cool
Glands	Produces fluids that mix with sperm cells to make semen
Sperm duct	Carries sperm cells from the testes to the urethra

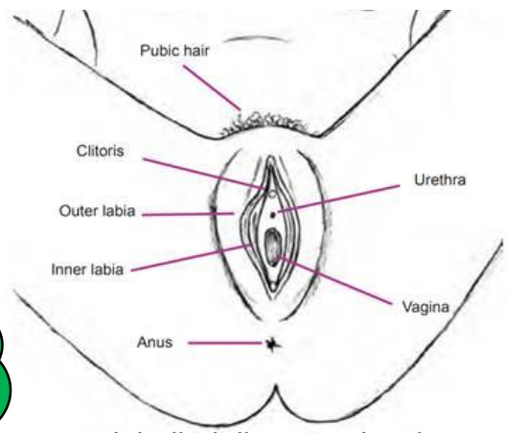

Did You Know?

The prostate gland is a walnut sized gland which produces fluid for semen. In older men it can become enlarged and make urination difficult

Did You Know?

In women the urethra has a single function unlike in males

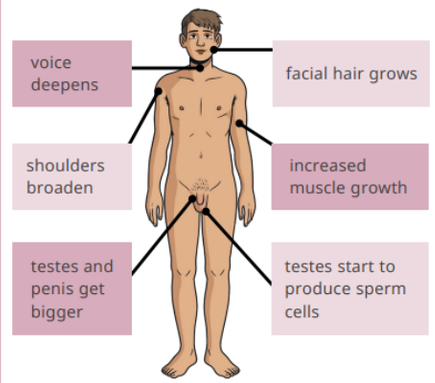

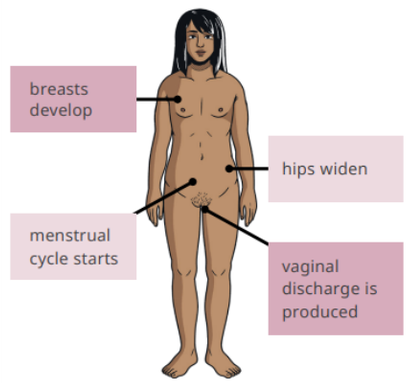

A labelled diagram showing the external female **genitalia**

Female external genitalia
- Only 10% of adults can identify all the parts of the female genitalia!
- The **vulva** is the area on the outside of the genitals, it includes the **clitoris** and the **labia**
- The labia (lips) have **an inner** and **outer set** of lips
- The vulva does not include the **anus** or **vagina**
- The **vagina** is actually the inside of the body and leads to the **uterus**

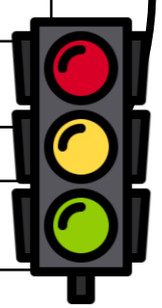

Part	Function
Vagina	A muscular tube that leads from the cervix to outside of the body
Cervix	A ring of muscle at the lower end of the uterus. This keeps the baby in during pregnancy
Ovary	Contains hundreds of undeveloped egg cells. Every month an egg cell matures and is released
Uterus	Where the baby develops during pregnancy
Oviduct	Carries egg cells from the ovaries to the uterus
Uterus lining	A blood-rich layer of tissue in which an embryo implants. This tissue is lost each month.

What happens during puberty?
- **Puberty** is a period of time when a person becomes **sexually mature**
- These changes are triggered by an increase in the levels of **sex hormones**, these are **chemical messengers**
- **Testosterone** in males and **oestrogen** in females
- Puberty causes **physical** and **emotional** changes

Puberty Changes in Males	Puberty Changes in Females
	

RAG Yourself!

Learning Outcomes;	RAG
Describe sexual reproduction	
Describe the main sexual characteristics in males and females	
Describe the role of hormones during puberty	
Label the internal male and female reproductive systems	
Label external female genitalia	
Describe the function of the parts of the female and male reproductive systems
